INTRODUCTION

According to Animal Act 1953 in part IV – Prevention of Cruelty to Animals, Section 44 (1) stated that any person who cruelly beats, kicks, ill-treats, overrides, overloads, tortures, infuriates or terrifies any animal, he or she shall be guilty of an offence of cruelty and shall be liable to a fine of two hundred Ringgit or to imprisonment for a term of six months or to both. This law clearly showed that how animal are important to be treated fair enough just like human being. The existence of this act helps to prevent animal abuse among public community and it also to ensure the safety of animals.

The “Pet Adoption and Pet care” is a web-based application which provides user friendly interface to automate the process of serving towards the welfare of the pets. It is a place where we can adopt, buy and sell pet animals and where stray, lost, and oned or surrendered pets are brought for adoption.

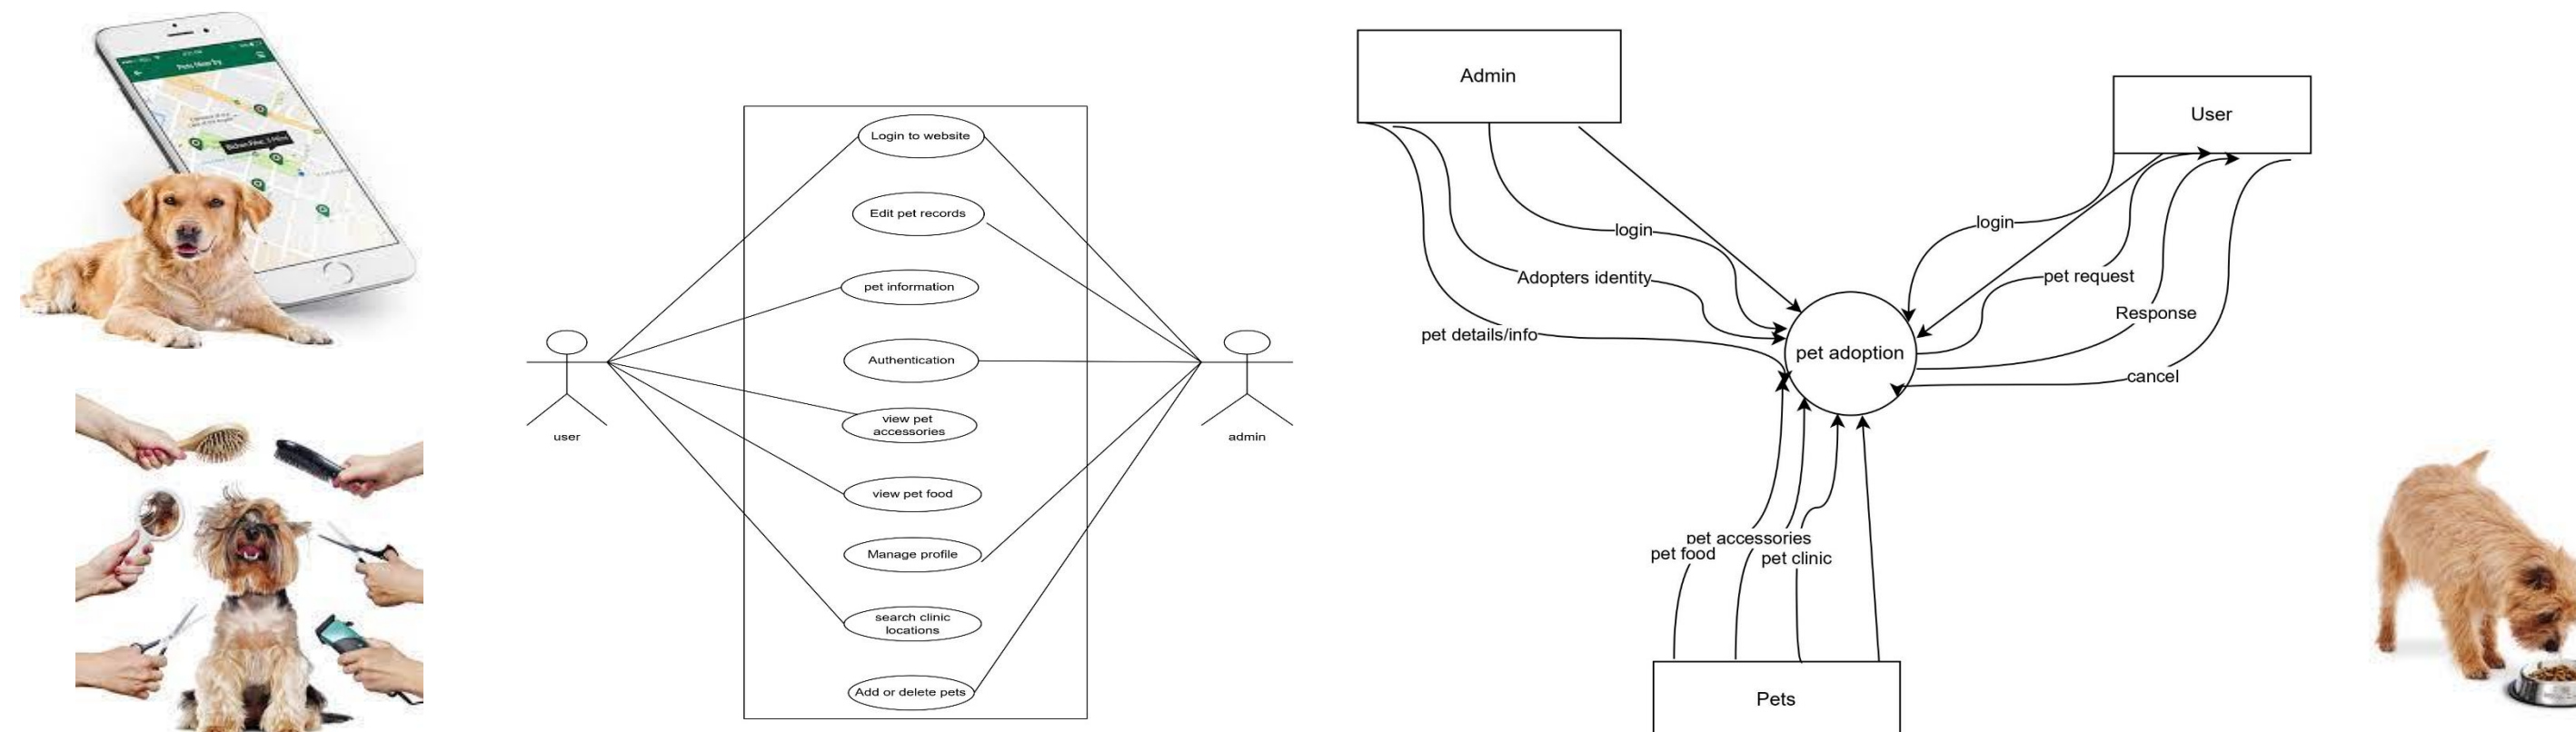

OBJECTIVE

The major objective of this app is to create a people friendly online platform where people come to know about various pet that require their help, so they can adopt them and take their pain away. The main aim of this application are as follows :-

1. To help stray animals by helping them to find a kind – hearted owner.
2. On this platform people can also upload photos of pet animals to sell and people who want to buy can contact them.
3. Through this app we can do rescue animals.
4. This app provides all products of pet animals at one place thus saves users time.

PROJECT DESCRIPTION

The user can do the adoption process through the application as this process is time-consuming if done manually. The user can register them to the organization through the application and choose their area of interest as to work as a volunteer, adopting a pet, or purchasing the products related to pets. For adoption as well as volunteering, the user can choose the pets that are in the organization view their details, and if they wish they can continue with the process of adoption or volunteer. The main idea of this project is to provide a user-friendly interface to automate the process of serving towards the welfare of the pets by giving the abandoned pets a place of shelter and care them with affection. The application also gives guidelines for caring for the pets, the adoption procedure of a pet, and volunteering towards the pets. The user of the app will also be able to search the pets by breeds and there will be also a small description about each breed. When the user selects a breed name a new tab will open which will contain the available animals of that specific breed along with their color, name and age. The user can also buy pet products like pet food, grooming products and medicines from our app.

RESULTS

The proposed system is design in HTML, CSS while developed using database and PHP. The project aims to introduce a “Pet-Friendly” or “User-Friendly” web application where shelters are found for abandoned animal whose information is uploaded on the site by the users connected here, that in result raises awareness among the people about the plight of strays and how each one of us can ensure a better and safer environment for these animals. This project will help connect people looking for a new pet with the right companion for them without paying extra to a middle man. The project also displays items that can be bought by users for their pets’ nourishment and care. When you get a dog from a pet store, the transaction usually ends once you exit the door. The interface of our website is very user friendly.

RESOURCE AND LIMITATION

Every user must go through a set of questionnaires provided by the system after signing up which will then be reviewed by the administrator when the user sends a request to adopt an animal. One of the limitations of this system is that the questionnaires can only be approved by the administrator and not approved automatically in the system, so the administrator has to manually go through each questionnaire done by the user to approve whether the user has the qualifications to adopt an animal or not. Also we are working on the real time notification system for better improvement. The search bar will also get better in future by adding more locations which will ease the work of finding pets.

CONCLUSION

I strongly believe that pet adoption can make our world better because people can change their life and become kinder and happier only showing mercy to animals and being responsible. When you adopt, not only do you save your loving new companion, but you make space for other animals who desperately need it, creating a domino effect of goodness. In our app we will give the users a common information about pets that which pet will suit them according to their lifestyle this is done by a few questioning before adoption. By our app :- People will come to know about stray animals that need their help around their vicinity. Through our app animals will get a right companion for them.
